

# HTML Paragraph

HTML paragraph or HTML p tag is used to define a paragraph in a webpage. Let's take a simple example to see how it work. It is a notable point that a browser itself add an empty line before and after a paragraph. An HTML `<p>` tag indicates starting of new paragraph.

If we are using various tags in one HTML file then browser automatically adds a single blank line between the two paragraphs.

# HTML Table

HTML table tag is used to display data in tabular form (row \* column). There can be many columns in a row.

We can create a table to display data in tabular form, using `<table>` element, with the help of `<tr>`, `<td>`, and `<th>` elements.

In Each table, table row is defined by `<tr>` tag, table header is defined by `<th>`, and table data is defined by `<td>` tags.

HTML tables are used to manage the layout of the page e.g. header section, navigation bar, body content, footer section etc. But it is recommended to use `div` tag over table to manage the layout of the page.

# HTML Table Attributes

HTML Attributes are assign by two methods :

- 1) Using HTML Attribute
- 2) By CSS Property

Various attributes of table tag are descibe below :

## 1) Table Border

You can use border attribute of table tag in HTML to specify border. But it is not recommended now.

## 2) Cell padding

You can specify padding for table header and table data by using cell padding. The cellpadding attribute of HTML table tag is obselete now.

## 3) Width

We can specify the HTML table width using the CSS width property. It can be specify in pixels or percentage.

# HTML Table Tags

Tag	Description
<code>&lt;table&gt;</code>	It defines a table.
<code>&lt;tr&gt;</code>	It defines a row in a table.
<code>&lt;th&gt;</code>	It defines a header cell in a table.
